ACKNOWLEDGEMENT

This report would not have been possible without my teachers who were always there when I needed them the most. I take this chance to acknowledge them and extend my sincere gratitude for helping me make this Report a possible.

I wish to thank my faculty mentor **Dr. Jayshri Patil** (assistant Professor), School of Engineering. It has been an honor to learn under their mentorship.

As my mentor, he has constantly motivated me to remain focused on achieving my goal. Their observations and guidance helped me to establish the overall direction of the report and to move forward with learning in depth. Their vital support at each juncture, which culminated in successful completion of my project work. I express my sincere gratitude to them for constant support during the project work.

I am also thankful to faculty members of the department for constant support and guidance.

I am thankful to Dean, School of Engineering for his initiative of imparting Project during tenure of your study making us learn new things and to help us in expanding our horizons.

Name of Student : **DHRUVIK JITENDRABHAI VAGHASIYA (21SE02IT062),**
BHUMIKA RAGHUVIRSINH RAVALJI (21SE02IT048),
SHRUSTI SHAILESHBHAI SHELADIYA (21SE02IT053).

ABSTRACT

This project aims to develop a secure and efficient web-based system for managing patient records using PHP and MySQL. The current healthcare system often faces challenges in managing patient records. Traditional paper-based systems can be inefficient, prone to loss or damage, and hinder easy access for authorized personnel. This project proposes the development of a secure and user-friendly web-based patient records management system (PRMS) built using PHP and MySQL. The PRMS aims to address these limitations by offering a centralized and readily accessible platform for managing patient data.

The PRMS provides functionalities tailored to different user roles. Patients can securely access their medical history, including details regarding consultations, surgeries, and diagnoses. This empowers them with increased transparency and allows them to review critical information such as dates, doctors involved, complaints presented, treatments received, and reference numbers. Authorized personnel, including doctors and staff, can manage patient records beyond simply viewing. This may involve functionalities like adding new entries, updating existing information, or managing access permissions. Additionally, the system incorporates a search function with various filters like doctor ID, date, and reference number. This allows for efficient retrieval of specific patient records, streamlining workflows and facilitating informed decision-making. By offering a centralized, secure, and accessible platform, the PRMS has the potential to significantly improve patient record management within the healthcare system.

1.OVERVIEW OF PROJECT

This project tackles the inefficiencies and security concerns associated with traditional paper-based patient record management systems. It proposes the development of a secure and user-friendly web application built using PHP and MySQL to address these challenges. The web-based patient records management system (PRMS) aims to improve healthcare record management by offering a centralized, readily accessible, and secure platform for storing and managing patient information.

The PRMS caters to the needs of both patients and authorized healthcare personnel. Patients will have secure access to their medical history, allowing them to view details of past consultations, surgeries, and diagnoses. This includes information like dates of service, involved doctors, reported complaints, administered treatments, and reference numbers. This level of transparency empowers patients with better understanding of their health journey.

Authorized personnel, such as doctors and staff, will have access to a broader range of functionalities beyond simply viewing records. They can add new entries for consultations, surgeries, or diagnoses, update existing information to ensure accuracy, and manage access permissions for different user roles within the system. Additionally, the PRMS incorporates a robust search function equipped with various filters. Doctors and staff can utilize filters like doctor ID, date of service, and reference number to efficiently retrieve specific patient records. This streamlines workflows, facilitates informed decision-making based on accurate and readily available patient data, and ultimately enhances the quality of care provided.

By offering a centralized, secure, and accessible platform for managing patient records, the PRMS has the potential to significantly improve healthcare record management practices. It promotes efficiency, mitigates the risk of data loss or damage, and empowers both patients and healthcare professionals with improved access to and control over crucial medical information

2. OBJECTIVE OF PROJECT

The objective of this project was to develop a Patient Record Management System (PRMS) using PHP and MySQL. This system aims to streamline the management of patient information within hospitals or clinics. It offers functionalities to create, store, access, and update patient records, including consultations, diagnoses, and surgeries.

By implementing user roles (admin, doctor, patient, staff) with secure access control, the PRMS ensures data privacy and authorized user interactions. The modular design allows for independent development and maintenance of specific features, promoting flexibility and future enhancements.

In essence, this project aimed to create a user-friendly and efficient system for managing patient data, enhancing workflow, and improving the overall healthcare experience for both patients and medical professionals.

3. INTRODUCTION

Moving on, this patient records management system project in PHP MySQL focuses mainly on dealing with patients regarding their consultation, diagnosis, and other records. Also, the system displays all the available data of their employee staff, patients, and doctors. The project is divided into Four categories: Admin, Patient, Doctor, and Staff Login. In an overview of this web app, the admin has the head of rights such as management of the users for the system. A user can also add hospital records from the admin panel. Talking more about the project, a patient account can view his number of records under various section such as consultation, surgery and diagnosis records. Here, the user can view full details including date & time, doctor name, complaints, treatments, reference number, etc. In terms of searching records, the user has to fill up certain details like doctor or staff's ID, date & time, and reference number.

4. SYSTEM ANALYSIS

Identification of Need :

This patient record management system project targets the inefficiencies of traditional paper-based methods, where records are prone to loss, retrieval is slow, and organization is cumbersome. By utilizing PHP and MySQL, the web application offers a secure solution for patients to access their consultation, surgery, and diagnosis details, while empowering administrators to manage users and add hospital records. Additionally, a search function with filters enhances accessibility for both patients and healthcare providers.

Preliminary Investigation :

A preliminary investigation reveals the need for a web-based patient records management system due to the inefficiencies of the current paper-based system. This new system, built with PHP and MySQL, aims to address issues like record loss, slow retrieval times, and lack of organization. It will provide functionalities for user management, secure patient access to their medical history, and potentially allow doctors and staff to view and manage records.

Feasibility Study :

Developing a Patient Record Management System (PRMS) using PHP and MySQL is technically achievable due to the open-source nature of the technologies. While there are operational challenges like user training and economic considerations like development costs, the potential benefits of improved workflow, data security, and cost savings in the long run make this project a feasible solution for managing patient data in hospitals and clinics.

5.METHODOLOGY

Step 01: Start

Step 02: User Authentication

- Develop a secure login system where users (hospital staff, doctors, patient) can sign in using credentials like email and other details.

Step 03: User Profile Creation and Management

- Implement a profile creation system where users can input necessary details such as name, contact information, diseases, medical issues, contact number, address and permissions. Users should also be able to manage and update their profiles.

Step 04: Patient Record Creation

- Develop a feature to create electronic health records (EHR) for patients. This includes capturing patient demographics, medical history, diagnosis, treatments, prescriptions, and other relevant data.

Step 05: Record Organization and Accessibility

- Enable users to organize patient records systematically, allowing for easy search, retrieval, and modification. Implement access controls to ensure that only authorized personnel can view or edit specific records.

Step 06: Audit Trails and Security Measures

- Implement to track changes made to patient records, ensuring transparency and accountability. Strengthen security measures to protect sensitive patient information from unauthorized access or breaches.

Step 07: Reporting and Analytics

- Develop reporting functionalities to generate insights from patient data, such as trends in diagnoses, treatment outcomes, and resource utilization. Provide analytics tools for administrators to optimize hospital operations and improve patient care.

Step 08: Exit & logout

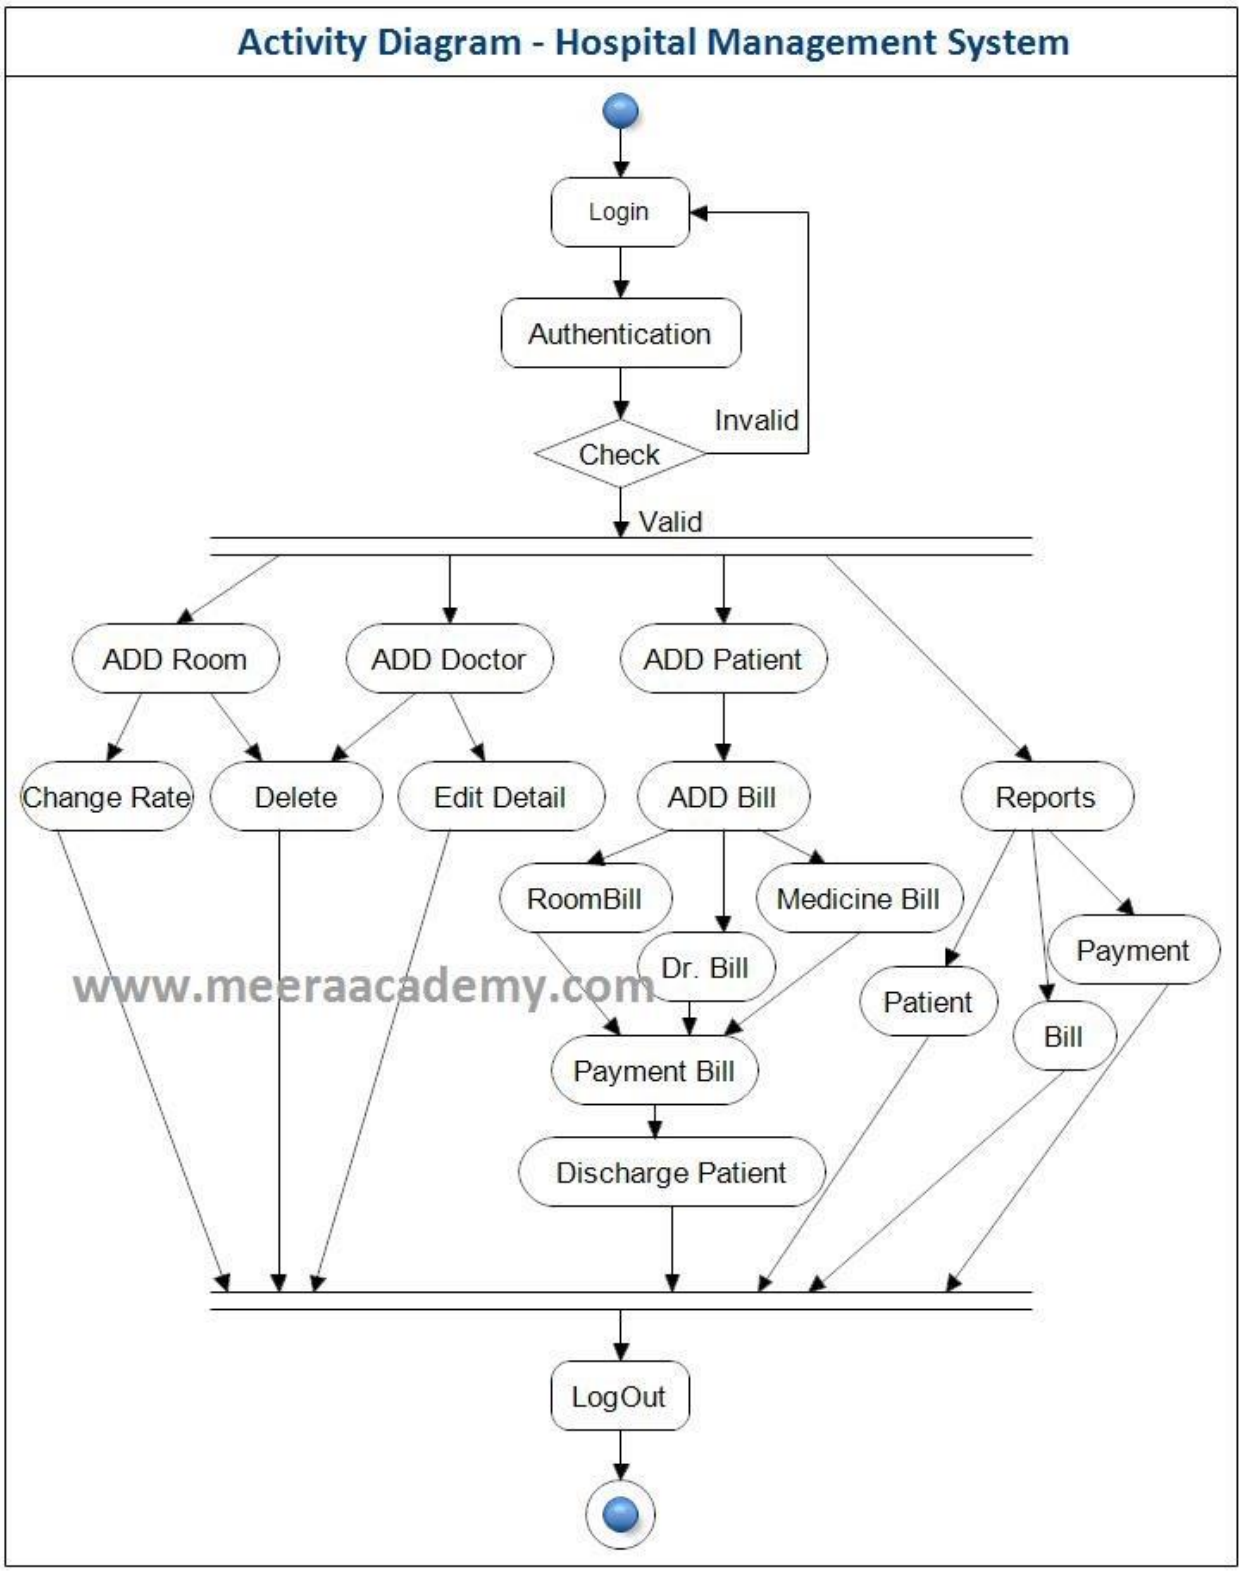

- Close the project or transition to a new phase, considering factors such as project completion, organizational changes, or can go to create a new profile.

6.PROJECT ANALYSIS

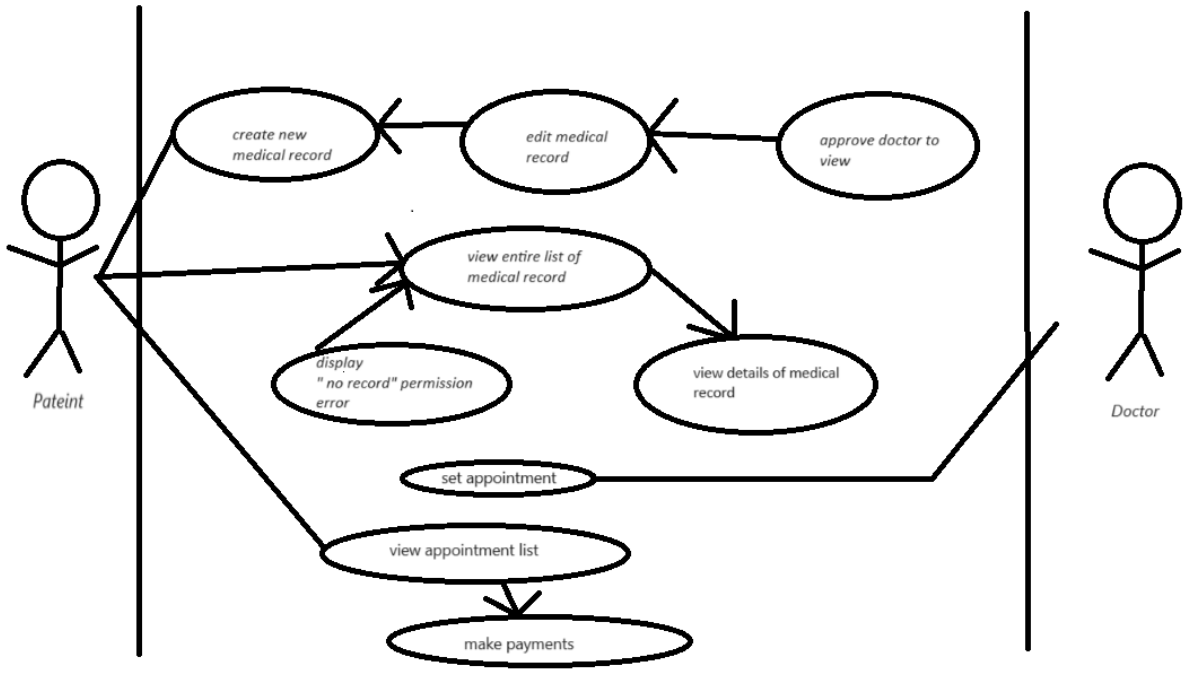

Project Planning :

- Start by Defining Requirements:
- Choose a PHP Framework:
- Database Design:
- User Authentication and Authorization:
- Patient Registration Module:
- Appointment Scheduling Functionality:
- Medical Record Management System:
- Billing Integration:
- Reporting Features:
- Testing & Quality Assurance:
- Deployment & Maintenance:

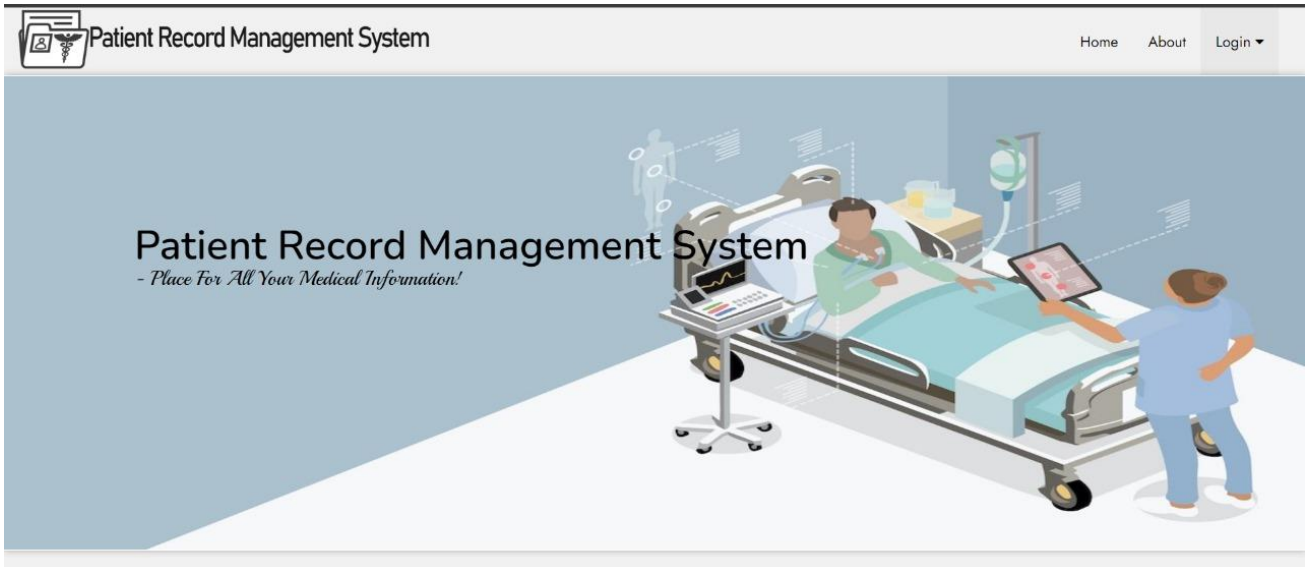

Sequence diagrams :

Usercase diagram :

User-Experience Analysis :

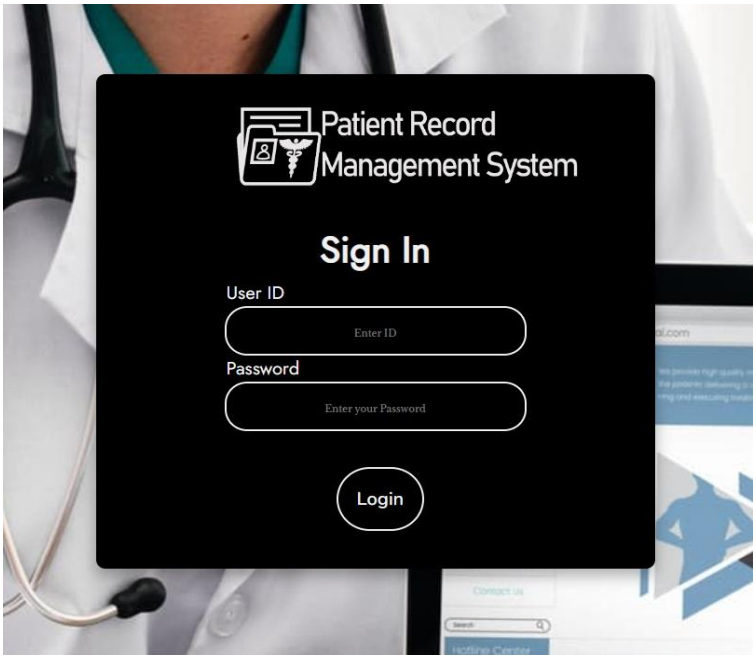

Here, There Is Three Log In Options Patient, Doctor And Staff.

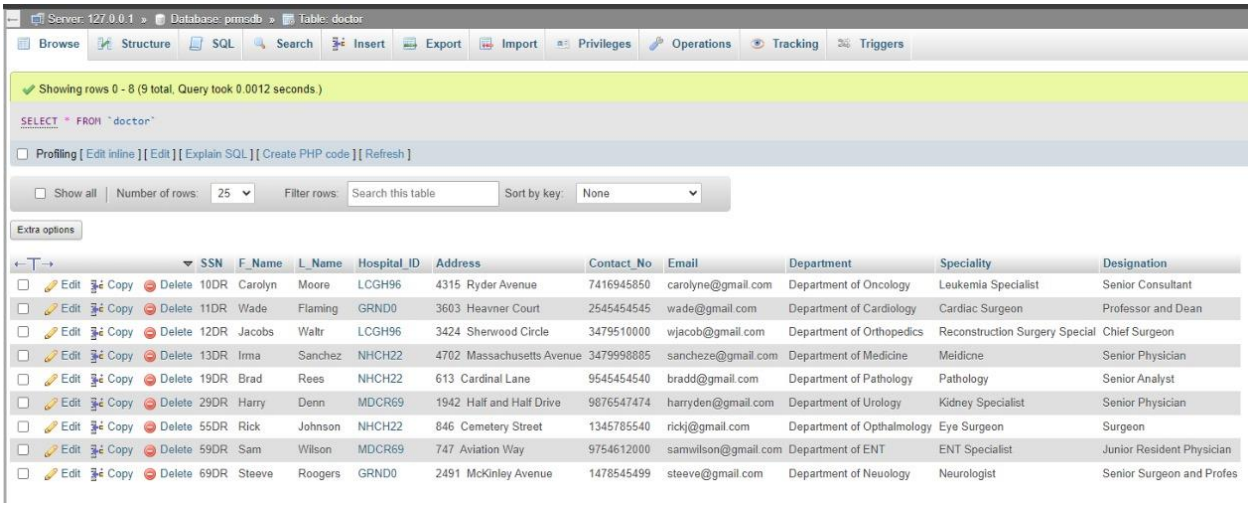

Staff And Doctor login.

Patient login.

7. Coding

The application leverages PHP for server-side scripting to handle user interactions and data manipulation. The codebase is likely structured with separate files for each page (e.g., staff_login.php, patient_records.php). Each page would utilize php forms for user input and interact with a MYSQL database to store and retrieve patient information. Login functionalities would involve verifying user credentials against the database, while record pages would likely use database queries to display relevant patient data based on user roles (staff, doctor, patient). Security measures like password hashing and access control mechanisms would be crucial for protecting sensitive patient information.

Admin panel page.

```
<?php
 session_start();
 if(!$_SESSION["userID"])
 {
   header("Location:admin.login.php?signin");
 }
 ?>
<!DOCTYPE html>
<html>
<head>
  <link rel="apple-touch-icon" sizes="180x180" href="Resource/favicon/apple-touch-icon.png">
  <link rel="icon" type="image/png" sizes="32x32" href="Resource/favicon/favicon-32x32.png">
  <link rel="icon" type="image/png" sizes="16x16" href="Resource/favicon/favicon-16x16.png">
  <link rel="manifest" href="Resource/favicon/site.webmanifest">
```

```
 <link rel="stylesheet" type="text/css" href="css/ddash_style.css">
 <title> Dashboard </title>
</head>
<body>
 <div class="top_img"><img src="Resource/land2.png"></div>
 <div class="navigation-bar" style="text-align: center">
  <a href="admin_panel.php" >Home</a>
  <a href="aregister.php">Register</a>
  <a href="adelete.php">Delete</a>
  <a class='logout' href="logout.php">Logout</a>
 </div>
</body>
</html>
```

Overall, this code ensures that only authenticated users with a valid session can access the admin panel. It provides navigation links to different functionalities within the panel and includes styling to improve the visual presentation of the page.

Doctor login page code.

This page provides staff members with an organized view of medical dosage records for patients under their care, enhancing efficiency in managing patient information.

In conclusion of overall coding. We've discussed a comprehensive set of PHP web pages designed for a medical system. The system comprises functionalities for both patients and staff members. Patients can log in through a dedicated page, access their medical records, and view details such as consultations, surgeries, diagnoses, and medicine administrations. Error handling mechanisms are in place to ensure a smooth user experience. Staff members, on the other hand, have their own login page and dashboard. They can insert medical dosage records for patients, with fields for detailed descriptions, complications, prescribed medicines, and allergies. Additionally, staff members can view patient records assigned to them, including all relevant medical dosage information. The system employs session management to maintain user authentication throughout the browsing session. Overall, these PHP pages offer a cohesive and user-friendly interface for managing medical records within a healthcare environment, ensuring data security and ease of use for both patients and staff members.

8. FUTURE SCOPE AND FURTHER ENHANCEMENT OF THE PROJECT

The Patient Record Management System (PRMS) built with PHP and MySQL offers a solid foundation for managing patient data. However, there's room for exciting advancements to cater to evolving healthcare needs.

Firstly, the system can be expanded to integrate with appointment scheduling software. This would streamline patient flow, optimize clinic operations, and enhance the overall patient experience. Additionally, functionalities for billing and insurance management can be incorporated, eliminating the need for separate systems and simplifying administrative tasks.

Furthermore, the PRMS can be equipped with robust reporting and analytics capabilities. This would empower healthcare providers to generate reports on patient demographics, treatment trends, and resource utilization. Data-driven insights can then be leveraged to improve service delivery, optimize resource allocation, and potentially identify areas for cost reduction. By incorporating these enhancements, the PRMS can transform from a data management tool into a strategic asset for informed decision-making within healthcare organizations.

9.CONCLUSION

Patient Record Management System (PRMS) built using PHP and MySQL. The system offers functionalities for managing patient information, consultations, diagnoses, and staff details. It features user roles (admin, doctor, patient, staff) with secure access control. The modular design allows for independent development and maintenance. While initially intended for educational purposes, the project demonstrates technical feasibility for real-world implementation in hospitals or clinics. Potential benefits include improved workflow efficiency, data security, and cost savings in managing patient records. Future enhancements could involve integration with appointment scheduling and billing systems, along with robust reporting and analytics capabilities, transforming the PRMS into a comprehensive tool for informed decision-making within healthcare organizations.
